

EBOLA SITUATION REPORT

30 DECEMBER 2015

SUMMARY

- No confirmed cases of Ebola virus disease (EVD) were reported in the week to 27 December. On 29 December, WHO declared that human-to-human transmission of Ebola virus has ended in Guinea, after the completion of 42 days with zero cases since the last person confirmed to have EVD received a second consecutive negative blood test for Ebola virus RNA. Guinea has now entered a 90-day period of heightened surveillance.
- Human-to-human transmission linked to the most recent cluster of cases in Liberia will be declared to have ended on 14 January 2016, 42 days after the 2 most-recent cases received a second consecutive negative test for Ebola virus, if no further cases are reported. In Sierra Leone, human-to-human transmission linked to the primary outbreak was declared to have ended on 7 November 2015. The country has now entered a 90-day period of enhanced surveillance scheduled to conclude on 5 February 2016.
- The 8th meeting of the Emergency Committee convened by the WHO Director-General under the International Health Regulations (2005) regarding the EVD outbreak in West Africa took place by teleconference on 15 December 2015. Based on the advice of the Committee, the Director-General declared that the 2014–15 Ebola outbreak continues to constitute a Public Health Emergency of International Concern.
- The most recent cluster of cases in Liberia was the result of the re-emergence of Ebola virus that had persisted in a previously infected individual. Although the probability of such re-emergence events is low, the risk of further transmission following a re-emergence underscores the importance of implementing a comprehensive package of services for survivors that includes the testing of appropriate bodily fluids for the presence of Ebola virus RNA. The governments of Liberia and Sierra Leone, with support from partners including WHO and US CDC, have implemented voluntary semen screening and counselling programmes for male survivors in order to help affected individuals understand their risk and take necessary precautions to protect close contacts. 405 male survivors had accessed semen screening services up to 27 December in Liberia and Sierra Leone. A network of clinical services for survivors is also being expanded in Liberia and Sierra Leone, with plans for comprehensive national policies for the care of EVD survivors due to be completed in January 2016.
- In order to effectively manage and respond to the consequences of residual Ebola risks, Guinea, Liberia, and Sierra Leone have each put surveillance systems in place to enable health workers and members of the public to report any case of illness or death that they suspect may be related to EVD to the relevant authorities. In the week to 27 December, 933 community death alerts were reported in Guinea from all of the country's 34 prefectures. Over the same period 9 operational laboratories in Guinea tested a total of 541 new and repeat samples (6 samples from live patients and 535 from community deaths) from only 14 of the country's 34 prefectures. In Liberia, 611 alerts were received from all 15 of the country's counties. The country's 5 operational laboratories tested 469 new and repeat samples (281 from live patients and 188 from community deaths) for Ebola virus over the same period. In Sierra Leone 1226 alerts were reported in the week to 20 December (the most recent week for which data are available). 734 new and repeat samples (10 from live patients and 724 from community deaths) were tested for Ebola virus by the country's 8 operational laboratories in the week ending 27 December.
- The deployment of rapid-response teams following the detection of a new confirmed case continues to be a cornerstone of the national response strategy in Guinea, Liberia, and Sierra Leone. Each country has at least 1 national rapid-response team, with strengthening of national and subnational rapid-response capacity and validation of incident-response plans continuing through December and January.

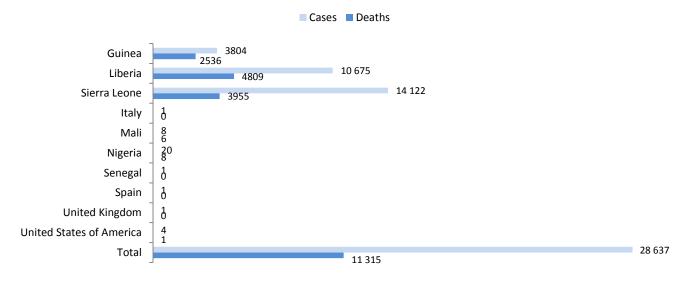

Table 1: Confirmed, probable, and suspected cases in Guinea, Liberia, and Sierra Leone

Country	Case definition	Cumulative cases	Cases in past 21 days	Cumulative deaths	
Guinea [#]	Confirmed	3351	0	2083	
	Probable	453	*	453	
	Suspected	0	*	+	
	Total	3804	0	2536	
	Confirmed	3151	-	+	
	Probable	1879	-	‡	
	Suspected	5636	-	\$	
1:6	Total	10 666	-	4806	
Liberia**	Confirmed	9	0	3	
	Probable	*	*	‡	
	Suspected	‡	*	‡	
	Total	9	0	3	
Sierra Leone [§]	Confirmed	8704	0	3589	
	Probable	287	*	208	
	Suspected	5131	*	158	
	Total	14 122	0	3955	
Total	Confirmed	15 215	0	‡	
	Probable	2619	*	‡	
	Suspected	10 767	*	‡	
	Total	28 601	0	11 300	

Data are based on official information reported by ministries of health. These numbers are subject to change due to ongoing reclassification, retrospective investigation and availability of laboratory results. *Not reported due to the high proportion of probable and suspected cases that are reclassified. [‡]Data not available. **Cases reported before 9 May 2015 are shaded blue. Due to ongoing surveillance and retrospective validation of cases and deaths, these totals may be subject to revision. [§]Sierra Leone was declared free of Ebola virus transmission in the human population on 7 November 2015, and has now entered a 90-day period of heightened surveillance. [#]Guinea was declared free of Ebola virus transmission in the human population on 29 December 2015, and has now entered a 90-day period of heightened.

PHASE 3 RESPONSE FRAMEWORK

28 601 confirmed, probable, and suspected cases have been reported in Guinea, Liberia, and Sierra Leone, with 11 300 deaths (table 1; figure 2) since the onset of the Ebola outbreak. The majority of these cases and deaths were reported between August and December 2014, after which case incidence began to decline as a result of the rapid scale-up of treatment, isolation, and safe burial capacity in the three countries. This rapid scale-up operation was known as phase 1 of the response, and was built on in the first half of 2015 during a period of continuous refinement to surveillance, contact tracing, and community engagement interventions. This period, termed phase 2, succeeded in driving case incidence to 5 cases or fewer per week by the end of July. This marked fall in case incidence signalled a transition to a distinct third phase of the epidemic, characterised by limited transmission across small geographical areas, combined with a low probability of high consequence incidents of re-emergence of EVD from reservoirs of viral persistence. In order to effectively interrupt remaining transmission chains and manage the residual risks posed by viral persistence, WHO, as lead agency within the Interagency Collaboration on Ebola and in coordination with national and international partners, designed the phase 3 Ebola response framework. The phase 3 response framework builds on the foundations of phase 1 and phase 2 to incorporate new developments in Ebola control, from vaccines and rapid-response teams to counselling and welfare services for survivors. The indicators below detail progress made towards attaining the two primary objectives of the phase 3 framework.

OBJECTIVE 1: RAPIDLY INTERRUPT ALL REMAINING CHAINS OF EBOLA TRANSMISSION

- Human-to-human transmission linked to the most recent cluster of cases in Liberia will be declared to have ended on 14 January 2016, 42 days after the 2 most-recent cases received a second consecutive negative test for Ebola virus, if no further cases are reported. Human-to-human transmission linked to the primary outbreak in Guinea was declared to have ended on 29 December 2015, 42 days after the country's most recent case, reported on 29 October, received a second consecutive negative blood test for Ebola virus RNA. The country has now entered a 90-day period of enhanced surveillance. In Sierra Leone, human-to-human transmission linked to the primary outbreak was declared to have ended on 7 November 2015. The country has now entered a 90-day period of enhanced surveillance scheduled to conclude on 5 February 2016.
- Investigations into the origin of infection of the cluster of 3 confirmed cases of EVD reported from Liberia in the week to 22 November have established that the cluster arose as a result of a rare re-emergence of persistent virus from a survivor. The first-reported case in that cluster was a 15-year-old boy who tested positive for Ebola virus after admission to a health facility in the Greater Monrovia area on 19 November. He was then transferred to an Ebola treatment centre along with the 5 other members of his family. Two other members of the family the boy's 8-year old brother and his 40-year-old father subsequently tested positive for EVD whilst in isolation. Both tested negative twice for Ebola virus on 3 December. The 15-year-old boy died on 23 November.

Table 2: Cases and contacts by prefecture/	county over the past 3 weeks
--	------------------------------

Country	Prefecture/	We	eek	21 Dec	22 Dec	23 Dec	24 Dec	25 Dec	26 Dec	27 Dec	Week 52	Contacts under follow

Subtotal		0	0	0	0	0	0	0	0	0	0	0
Liberia	Montserrado	0	0	0	0	0	0	0	0	0	0	0
Subtotal		0	0	0	0	0	0	0	0	0	0	0
Total		0	0	0	0	0	0	0	0	0	0	0

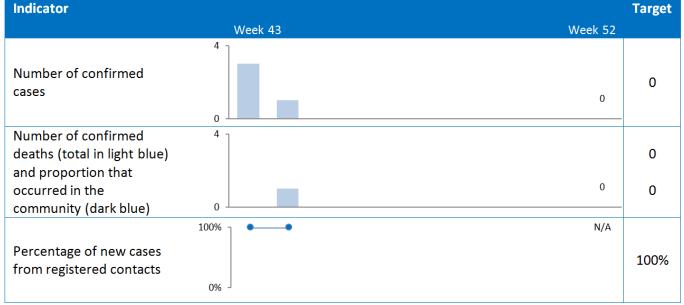

Data are based on official information reported by ministries of health. These numbers are subject to change due to ongoing reclassification, retrospective investigation, and availability of laboratory results. *Data as of 27 December 2015.

Table 3: Location and epidemiological status of confirmed cases reported in the 3 weeks to 27 December 2015

		Cult	Week 50	Week 51	Week 52 (21–27 December 2015)					
Country	Prefecture/ County	Sub- prefecture/ District	(7–13 Dec 2015)	(14–20 Dec 2015)	Cases	On contact list	Epi- link*	Unknown source of infection [‡]	Confirmed community death [§]	Date of last confirmed case
Guinea	Forecariah	Kaliah	0	0						29/10/2015
Subtotal			0	0	0	0	0	0	0	
Liberia	Montserrado	Greater Monrovia	0	0						20/11/2015
Subtotal			0	0	0	0	0	0	0	
Total			0	0	0	0	0	0	0	

*Epi-link refers to cases who were not registered as contacts of a previous case (possibly because they refused to cooperate or were untraceable), but who, after further epidemiological investigation, were found to have had contact with a previous case, OR refers to cases who are resident or are from a community with active transmission in the past 21 days. [‡]Includes cases under epidemiological investigation. [§]A case that is identified as a community death can also be registered as a contact, or subsequently be found to have had contact with a known case (epi-link), or have no known link to a previous case.

Table 4: Key performance indicators for phase 3 objective 1 in Guinea

For definitions of key performance indicators see Annex 1. Week 43 commenced 19 October. Week 52 ended 27 December 2015.

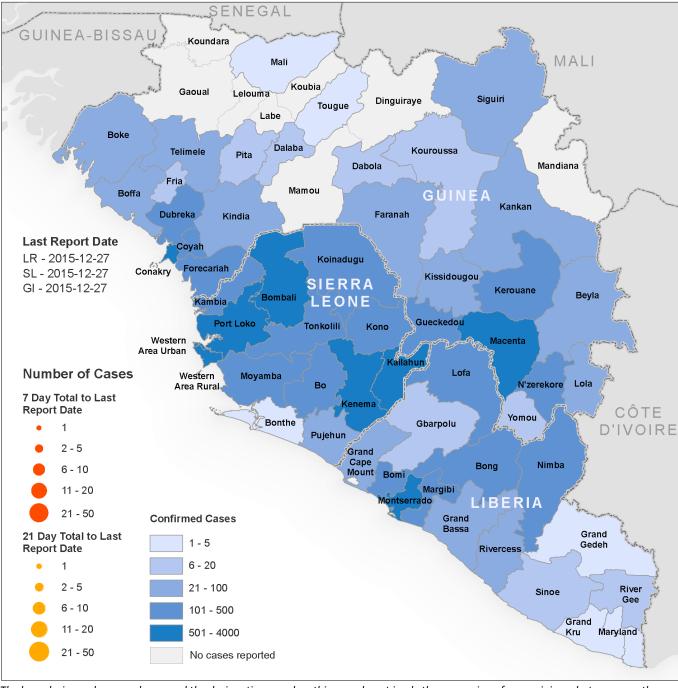

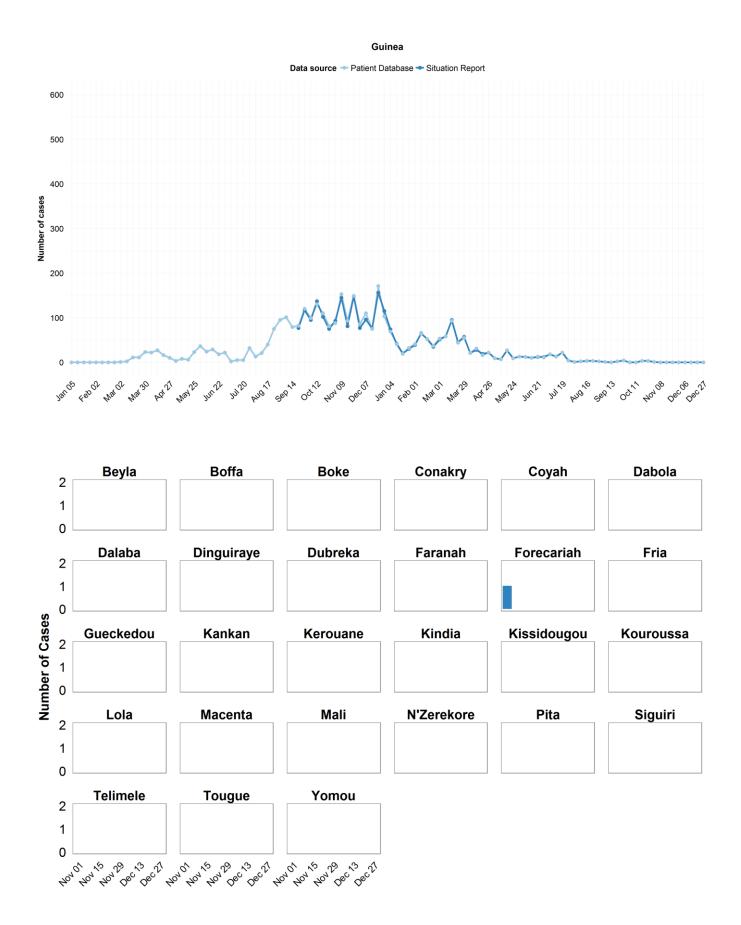

Figure 2: Geographical distribution of new and total confirmed cases in Guinea, Liberia, and Sierra Leone

The boundaries and names shown and the designations used on this map do not imply the expression of any opinion whatsoever on the part of the World Health Organization concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement.

Figure 3: Confirmed weekly Ebola virus disease cases reported nationally and by prefecture from Guinea

OBJECTIVE 2: MANAGE AND RESPOND TO THE CONSEQUENCES OF RESIDUAL EBOLA RISKS

- Key performance indicators for objective 2 of the phase 3 response framework are shown for Guinea, Liberia, and Sierra Leone (table 5). A full list of phase 3 response indicators can be found in annex 2.
- The most recent cluster of cases in Liberia is now understood to have been a result of the re-emergence of Ebola virus that had persisted in a previously infected individual. Although the probability of such re-emergence events is low, the risk of further transmission following an incident of re-emergence underscores the importance of implementing a comprehensive package of services for survivors that includes the testing of appropriate bodily fluids for the presence of Ebola virus RNA. The governments of Liberia and Sierra Leone, with support from partners including WHO and US CDC, have implemented voluntary semen screening and counselling programmes for male survivors in order to help affected individuals understand their risk and take necessary precautions to protect close contacts. A network of clinical services for survivors is also being expanded in Liberia and Sierra Leone, with plans for comprehensive national policies for the care of EVD survivors due to be completed in January 2016. Planning is also underway in Guinea, but is currently at an earlier stage of development.
- To manage and respond to the consequences of residual Ebola risks, Guinea, Liberia, and Sierra Leone have each put surveillance systems in place to enable health workers and members of the public to report any case of febrile illness or death that they suspect may be related to EVD to the relevant authorities. In the week to 27 December, 933 community death alerts were reported in Guinea from all of the country's 34 prefectures. In Liberia, 611 alerts were received from all 15 of the country's counties over the same period. 1226 alerts were reported in Sierra Leone in the week to 20 December (the most recent week for which data are available).
- As part of each country's EVD surveillance strategy, blood samples or oral swabs should be collected from any live or deceased individuals who have or had clinical symptoms compatible with EVD. In the week to 27 December, 9 operational laboratories in Guinea tested a total of 541 new and repeat samples from only 14 of the country's 34 prefectures. The trend in the number of samples tested each week has remained flat for the past two months. 99% of all samples tested in Guinea were swabs collected from dead bodies. By contrast, 60% of the 469 new and repeat samples tested in Liberia over the same period were blood samples collected from live patients. In addition, 14 of the 15 counties in Liberia submitted samples for testing by the country's 5 operational laboratories. 734 new and repeat samples were collected from all 14 districts in Sierra Leone and tested by 8 operational laboratories. 99% of samples in Sierra Leone were swabs collected from dead bodies (table 5; figures 4 and 5).
- 933 deaths in the community were reported from Guinea in the week to 27 December through the country's alert system (table 5). This represents approximately 42% of the 2248 community deaths expected based on estimates of the population and a crude mortality rate of 11 deaths per 1000 people per year. 110 deaths in the community were reported from Liberia over the same period, representing approximately 11% of the 982 community deaths expected per week. 1039 deaths in the community were reported from Sierra Leone in the week to 20 December, representing approximately 50% of the 2075 community deaths expected per week.
- The deployment of rapid-response teams following the detection of a new confirmed case continues to be a
 cornerstone of the national response strategy in Guinea, Liberia, and Sierra Leone. Each country has at least 1
 national rapid-response team, with strengthening of national and subnational rapid-response capacity and
 validation of incident-response plans continuing through December 2015 and January 2016.

PREVIOUSLY AFFECTED COUNTRIES

Seven countries (Italy, Mali, Nigeria, Senegal, Spain, the United Kingdom, and the United States of America) have previously reported a case or cases imported from a country with widespread and intense transmission.

PREPAREDNESS OF COUNTRIES TO RAPIDLY DETECT AND RESPOND TO AN EBOLA EXPOSURE

- The introduction of an EVD case into unaffected countries remains a risk as long as cases exist in any country. With adequate preparation, however, such an introduction can be contained through a timely and effective response.
- WHO's preparedness activities aim to ensure all countries are ready to effectively and safely detect, investigate, and report potential EVD cases, and to mount an effective response. WHO provides this support through country support visits by preparedness-strengthening teams (PSTs) to help identify and prioritize gaps and needs, direct technical assistance, and provide technical guidance and tools.

Priority countries in Africa

- The initial focus of support by WHO and partners is on highest priority countries Côte d'Ivoire, Guinea-Bissau, Mali, and Senegal—followed by high priority countries—Benin, Burkina Faso, Cameroon, Central African Republic, Ethiopia, Gambia, Ghana, Mauritania, Niger, South Sudan, and Togo. The criteria used to prioritize countries include the geographical proximity to affected countries, the magnitude of trade and migration links, and the relative strength of their health systems.
- Since October 2014, technical support has been provided to Benin, Burkina Faso, Cameroon, Central African Republic, Côte d'Ivoire, Ethiopia, Gambia, Ghana, Guinea-Bissau, Mali, Mauritania, Niger, Senegal, South Sudan, and Togo through team missions and targeted technical support. Technical working group meetings, field visits, high-level table-top exercises, and field simulations have helped to identify key areas for improvement. Each country has a tailored plan to strengthen operational readiness.
- From October 2014 to December 2015, WHO has undertaken over 341 field deployments to work with Ministries of Health to address gaps or as part of multi-partner teams to support preparedness efforts and to assist with the implementation of national plans.
- WHO provides personal protective equipment (PPE) modules containing minimum stocks to cover staff protection and other equipment needs to support 10 patient-beds for 10 days for all staff with essential functions. PPE modules have been delivered to all countries on the African continent. In addition, all countries have received a PPE training module.
- Contingency stockpiles of PPE are in place in the United Nations Humanitarian Response Depots in Accra and Dubai, and are available to any country in the event that they experience a shortage.

Ongoing follow-up support to priority countries

- Following initial PST assessment missions to the priority countries in 2014, a second phase of preparednessstrengthening activities have provided support on a country-by-country basis.
- Technical support is provided at the request of the respective ministries of health to strengthen EVD preparedness by operationalizing plans, testing systems, building capacity, and providing technical guidance.

EVD preparedness officers

Dedicated EVD preparedness officers have been deployed to support the implementation of country preparedness plans, coordinate partners, provide a focal point for inter-agency collaboration, offer specific technical support in their respective areas of expertise, and develop capacity of national WHO staff. Preparedness officers are currently deployed to Benin, Burkina Faso, Cameroon, Central African Republic, Côte d'Ivoire, Ethiopia, Gambia, Guinea-Bissau, Mauritania, Niger, Senegal, and Togo.

Training, exercises, and simulations

- Priority countries that have achieved a minimum of 50% implementation of Ebola preparedness checklist
 activities are encouraged to test outbreak preparedness and response by undertaking a series of skill drills and
 simulations on elements of an EVD response.
- Two technical staff have been appointed and are currently working with high priority countries to conduct needs assessment for surveillance training.
- In Togo, WHO will be providing support to the Ministry of Health with risk mapping to prioritise risks and develop targeted preparedness plans in January 2016.

Surveillance and preparedness indicators

- Indicators based on surveillance data, case management capacity, laboratory testing, and equipment stocks continue to be collected on a weekly basis from the four countries that share a border with affected countries: Côte d'Ivoire, Guinea-Bissau, Mali, and Senegal.
- An interactive preparedness dashboard based on the WHO EVD checklist¹ is available online.
